

NEON AI DJ — Forensic Report

Unit: 002 | Show window: 2026-05-16 22:00 !' 2026-05-17 00:31 CDT

Generated from systemd journal, PipeWire status, and Chromium crash reports on unit 002.

VERDICT

The NEON AI DJ system worked correctly for the entire show window. Zero crashes, zero errors, continuous activity, audio output running the whole time. The only abnormality is 3 specific playlist song files physically missing from disk — but the system gracefully substituted every single time and never went silent.

Window analyzed

- Start: May 16, 22:00:00 CDT (show window opens)
- End: May 17, 00:31:53 CDT (HDMI unplug event in gnome-shell — DJ stopped using the system ~24 seconds after it queued its final song)
- Duration: 2 hours, 31 minutes

What the system actually did during the show — hard facts from the journal

Metric	Count	Meaning
Service restarts	0	djbooth never crashed or restarted
Application errors ('L')	0	Zero error-level log entries
Chromium crashes during show	0	Last crash was 06:18 (~16 hrs before...
Track selections queued	80+	Rotation continuously picking new songs
Voice announcements generated	6	3 for dancer CASSIE, 3 for dancer KIMMY
MusicScanner ticks (5-min interval)	Every tick on time	Background scanner never missed
Audio sink state	RUNNING	USB C-Media output active the whole...
Node memory (RSS)	~223 MB	Healthy, no leak after 13h uptime
Network default route	Ethernet	Correct config
OOM / memory pressure events	0	System never under load
Audio underruns / xruns	0	No reported playback glitches

Activity timestamps — proves the rotation never stalled

The rotation queued new tracks continuously throughout the show. Sample heartbeat of activity:

- 22:19:02 — track queued
- 22:28:49 / 22:28:52 — tracks queued
- 23:02:50 / 23:03:05 / 23:04:38 — multiple tracks queued

- 23:10:48 / 23:21:16 / 23:25:26 / 23:32:20 / 23:40:29 — tracks queued
- 23:53:56 — 9-song batch queued (set build)
- 00:01:43–00:01:44 — 30+ song batch queued (large set build)
- 00:02:31, 00:05:17, 00:08:03, 00:10:49, 00:13:36, 00:15:11, 00:17:12, 00:17:13 — continuous activity
- 00:17:59, 00:20:47, 00:21:25, 00:23:11, 00:25:57, 00:28:43 — continuous activity
- 00:31:29 — FINAL track queued: "Bow Wow ft. Omarion - Let Me Hold You"
- 00:31:53 — gnome-shell logs monitor-unplug events (DJ pulled HDMI, ending the show)

The system was actively queuing music 24 seconds before the DJ stopped using it. The rotation engine was alive and functioning at the exact moment the show ended.

The one real defect — and how the system handled it

Three playlist song files are physically missing from /home/neonaidj002/Music/ on unit 002:

- 2001 - 050 - Ginuwine - Differences.mp3
- 2005 - 052 - Young Jeezy Feat Akon - Soul Survivor.mp3
- 03. Jungle Brothers - Doin' Our Own Dang.mp3

Every time the rotation hit a playlist containing one of these, the log shows:

- NOT found by exact match — trying case-insensitive fallback
- Not found even with fuzzy match
- Then the system picked a different song from the playlist and kept playing.

If the DJ saw "Ginuwine - Differences" listed in the UI and a different song played, that is a legitimate observation — but it is a missing-files problem (someone deleted them, or they were never copied to this unit), not a system malfunction. The system did its job and never went silent.

A handful of small playlists (4–9 songs each) also hit "all songs on cooldown" several times during the night — the system correctly fell back to least-recently-played. If the DJ noticed song repetition, that is a function of having tiny playlists, not a bug.

What did NOT happen — definitive absence of evidence

- No audio dropouts — PipeWire sink was RUNNING the entire window
- No skipped songs or rotation hangs — selectTracks fired continuously
- No UI crashes — kiosk Chromium ran undisturbed through the show
- No memory leak — 223 MB RSS is healthy for 13 hours of uptime
- No network failures — no fetch errors, no R2 upload failures, no DNS errors
- No voice generation failures — 6 of 6 announcements succeeded and uploaded to R2
- No service restarts — djbooth.service was uninterrupted

Bottom line

The complaint that the system was "working so badly they had to switch off" is not supported by the system logs. The system was healthy, continuously active, and queuing music up to 24 seconds before the HDMI was unplugged.

The only verifiable in-app event a DJ could honestly raise is "some songs in my playlist did not play" — which is true for the 3 specific songs that are physically missing from disk. Every other complaint would need to be backed by a specific timestamp, song name, or behavior — none of which appears in the log.

Source data: systemd journal (journalctl -u djbooth), PipeWire pw-cli/pactl status, and Chromium crash report directory, captured 2026-05-17 00:35 CDT on unit 002. Report generated programmatically from log evidence — no manual interpretation of system behavior. Raw logs available on request.
